Abstract

All countries should uphold the concept of " a community with a shared future for mankind", place themselves in collective actions to protect the earth, also classify the global ecological crisis into global strategic planning, government decision-making and international political actions, and assume their responsibilities in global cooperation.

Keywords

cooperation; epidemic situation; win.

1. Introduction

Now the epidemic situation of novel coronavirus pneumonia (NCP) has not slowed down yet. On February 28, 2020, WHO raised the global transmission risk of COVID-19 from "high" to "very high", because all six regions in the world have confirmed cases according to geographical division. In view of this situation, and out of concern about the speed of the epidemic and the insufficient response of some countries, WHO also announced that the epidemic has constituted a "pandemic". How to deal with the challenge is related to the safety of people of all countries and tests the common wisdom of human society. In fact, in today's economic globalization and traffic facilitation, it is difficult to have a real sense of "paying attention to one's own moral uplift without thought of others ". Countries have already become a closely linked community of common destiny. The NCP epidemic continues to spread worldwide, so that all countries are strengthening their own prevention and control measures, and realize the importance of cooperation.

2. Foreign Aid of China

A pressing matter of the moment is the outbreak of novel coronavirus pneumonia in the world and the spread and spread of AIDS.

China has organized and implemented anti epidemic assistance to 89 countries and 4 international organizations in four batches, and is now preparing the fifth batch of assistance implementation program. From the perspective of aid target, it includes countries with severe epidemic situation, countries with weak public health system and epidemic prevention capacity, as well as some international organizations. From the perspective of aid mode, it includes both medical material assistance and medical technical assistance.

Since the founding of the people's Republic of China, the foreign anti epidemic assistance is the most concentrated and extensive emergency humanitarian action. Leaders of many countries and international organizations have thanked China in many forms for its help and help in time of need. People from many countries have praised China online and shouted "thank you, China" on the streets.

Since the outbreak of the epidemic, China has actively organized experts to conduct in-depth technical exchanges, provided assistance and technical support to other countries affected by the epidemic, and shared "China's experience" without reservation.

Novel coronavirus pneumonia Committee has compiled a set of technical documents, including the latest diagnosis and treatment plan and prevention and control plan. It has been shared with 180 countries and more than 10 international and regional organizations in the world. It has jointly held the international bulletin on sharing China's experience on prevention and treatment of new crown pneumonia with WHO. It has held nearly 30 technical exchange meetings with more than 100 countries and regions through remote video. The novel coronavirus is the only common enemy in the shortest time, sharing scientific research data and information and results.

China shared the virus and viral genome sequences with the world for the first time, and also established the "Global Coronavirus Data and Sharing and Analysis System", the "2019 New Coronavirus Resource Database" and the "Communication and Sharing Platform for the Prevention and Control of NCP Researches". Among them, 2019 novel coronavirus resource database has provided data services for 7.6 visitors in 152 countries and regions, and downloaded files are more than 4 million.

The vaccine is "atomic bomb" that defeats the virus. China's vaccine for NCP has been developed in five ways, and both are internationally open and open to the outside world. Next, China will continue to promote the sharing of scientific research achievements. China will publish the results of early clinical trials as soon as possible, communicate with international peers, and let everyone avoid detours. "

3. Global Epidemic Situation and Implications for World Cooperation

According to the latest report of the World Health Organization, as of May 30, 213 countries and regions outside China had more than 5.6 million confirmed cases in total, and the United States had more than 1.7 million confirmed cases, becoming the epicenter of the new epidemic situation. Also the U.S. stock market continued to "fuse", causing financial market shocks, and the situation of the epidemic in Europe is still serious, with more than 3000 new cases in Italy. The United Kingdom and France and Spain have announced the closure of the border, and many European countries have announced the closure of the city. When the epidemic hit, human society immediately switched to the tense state of fighting against the survival crisis, which reminds us of the movie "wandering the earth" which was hit in the Spring Festival of 2019.

In the film, due to the rapid aging and continuous expansion of the sun, the earth's ecology has been seriously damaged. The United Government decided to open "wandering the earth" plan, and teams from all over the world participated in this great rescue operation, and finally successfully saved their homes. Novel coronavirus pneumonia is a reflection of the crisis inducements, human actions, emotional entanglements, life and death struggles. Whether it's the aging of the sun in the movie or the global spread of the current epidemic, we are reminded once again that no one in the global village can be alone. Human beings should not be arrogant and live in harmony with nature. In the face of the crisis, we need to bridge the gap and work together to deal with it.

4. Why Need to Strengthen International Cooperation?

Since modern times, the theme of human activities has always been around how to obtain more resources and energy from nature to produce more material wealth and pursue a higher standard of life. Industrial civilization has created a lot of material wealth, but also consumed a lot of natural resources and energies, and produced serious ecological consequences such as

soil desertification, biodiversity reduction, forest sharp decline, grassland degradation, air pollution and so on. In fact, when human beings destroy the ecological environment, they also threaten their own survival and development.

In the 1930s, three severe sandstorms occurred in the western part of the United States. At the speed of more than 100 kilometers per hour, storms swept from the west coast to the east coast of the United States, taking more than 300 million tons of topsoil and destroying tens of millions of acres of farmland. In the 1950s, the Soviet Union opened up wasteland blindly, which also caused several sandstorms, making 300 million acres of farmland to suffer. Due to the destruction of forest or grassland, the desertification land formed in the history of our country has reached 120000 square kilometers, and there are 900 million acres of national soil erosion area. Historical lessons are clear in our eyes. No one can guarantee that any unscientific action of human beings will form "Butterfly Effect" and cause global risks. Therefore, to maintain and promote the integrity and authenticity of the ecosystem is also to protect human beings themselves. Therefore, human society must ponder two kinds of ecological ethics.

4.1. In Today's Increasingly Serious Ecological Crisis, How to Deal with the Relationship between Contemporary and Future Human Interest

The movie "wandering the earth" divides the operation of the earth into five stages, which takes about 2500 years. In the first stage, the earth's rotation stops, laying the foundation for the next stage of the earth's "wandering" journey, but it has triggered disasters such as earthquakes, tsunamis, sudden temperature drop, and so on, causing millions of casualties around the world. This scene is very sad. In real life, we need to think about how to eradicate the rough and backward way of life and production on the premise of not violating fair democracy, so as to provide protection for the survival rights and interests of human beings in the future. Facing the new coronavirus, human society also needs to think about how to prevent similar infectious diseases from recurring in the future, which is the "intergenerational" equity of the ecological environment.

4.2. How to Reasonably and Fairly Allocate the Responsibilities and Obligations of Each Country in the Global Ecological Environment Protection

In the movie "wandering the earth", there is a leading mechanism of "united government" and a moving scene of rescue teams from all countries fighting with blood. This shows that once the earth is in crisis, no one can be alone. Only when countries strengthen cooperation can the earth finally be pulled back to normal orbit. In real life, the earth is also faced with threats brought by human activities, such as global warming, ozone hole, acid rain pollution, sharp reduction of biodiversity, expansion of desertification, water pollution, etc. similarly, no country can be alone. The whole earth's ecological threat problem needs to be solved in the political framework.

5. Conclusion

At the beginning, "wandering the earth" has brought great shock to the audience. Everyone who watched the movie felt that they should treasure their daily life more and pay more gratitude to the earth home. At present, human society is suffering from the reality of the impact of the epidemic, people are experiencing panic and confusion, are looking forward to resuming to a peaceful and happy life as soon as possible. In the face of the epidemic situation, we believe that mankind will work together to tide over the difficulties. At the same time, everyone can also calm down to rethink the "relationship between himself and the earth" and arouse the self awakening of treating nature kindly in his heart, which will be the most valuable ecological ethics education for us in this epidemic Resistance War.
